# Browser in Incognito with Windows Shortcut Properties

To use the windows shortcut properties to open a browser in incognito mode we just need to change the shortcut parameter (like in Python command, but it is directly and can be used on start menu shortcuts)

First Step: open the directory of the shortcut (or create one)

Second Step: right click the shortcut and go to 'properties'

Third Step: go to 'target' property and add the parameter -incognito (or -inprivate if your browser is using different parameters names

"C:\Program Files (x86)\Microsoft\Edge\Application\msedge.exe -inprivate"
